Renovation of façades
ETICS systems

Reworking variants – Procedural steps – Products

Solution: full replacement of the render/plaster coating

Problem: the entire surface of the finishing plaster and rendering on EPS insulation is damaged and cannot be repaired
Renovating ETICS system façades

All façades are subject to a wide range of stresses and a natural ageing process, depending on the building type, use, location and maintenance. As such, it is necessary to carry out renovation work at corresponding intervals. Depending on the condition, the reasons for this work and the steps to be taken can vary greatly:

- Visual refresh of aged and dirty façades
- Cleaning and reworking of surfaces affected by algae/fungus
- Remodelling (colours, render/plaster texture)
- Material replacement if areas are weathered or damaged
- Damage repair
- Energetic optimisation with additional insulation layers

Prerequisite

As for all façade renovations, the actual property condition must always be precisely determined beforehand. This analysis involves, for example, the elimination of all construction factors giving rise to damage, such as inadequate measures for channelling water, leaking connections or inadequate roof overhangs. The material of the existing ETICS system must also be professionally checked for load capacity, the type of finishing coat (compatibility) and any possible defects.

A Cinderella transformation

Thanks to the diverse range of options, all old buildings can be given a new lease of life. Regardless of whether the building is designed to house one, two or several families, economical renovations with ETICS systems will add value for all occupants.
External Thermal Insulation Composite Systems (ETICS) have been widely used to insulate façades for more than 50 years. Long-term scientific observations have shown that the service life and necessary renovation intervals are identical to those of conventional rendered masonry if the system has been applied, maintained and repaired correctly.

### Type of reworking
Depending on the diagnosed condition, various variants may apply:

- **Paint coating**
  - Visual refresh of aged and dirty façades
  - Reworking of areas affected by algae
  - Elimination of fine cracks in the render/plaster

- **Partial repair**
  - Elimination of defects or damage in the area of
    - The finishing plaster
    - The finishing plaster and base rendering
    - The coating incl. insulating material

- **Filler treatment over the entire surface and new plasterwork**
  for unsightly areas or if new render/plaster texture is desired.

- **Full replacement of the render/plaster system**
  if surfaces have been destroyed or if coatings have been applied incorrectly.

- **Doubling (over-insulating)**
  if the insulation is inadequate or to be optimised.

The necessary steps and materials to be used are described for typical example cases. A combination of various measures may of course be necessary for a particular structure. The examples refer to ETICS systems with surface coatings of synthetic resin-, silicone resin-, silicate- or lime cement renders/plasters.

### Caparol Property Service
Caparol offers technical and design support for the renovation of ETICS façades.

The compulsory precise analyses of the actual property condition form the basis of the overall planning. Without such overall planning, technically and economically viable solutions cannot be developed. The objective of any renovation is a long lasting and durable property.

Caparol supports you by determining the actual condition of the property through inspections, supplemented by on-site analyses and tests if required.

Based on this condition analysis we elaborate together with your planning group an appropriate repair concept, which contains basic advises as well as recommendations for an optimal repair programme.

From this repair programme we develop adequate specifications containing an individual adapted range of our high quality products. Our experts stand ready for questions of your construction management.

In addition to this technical service, the Caparol ColorDesignStudio offers high-quality design support. This covers the design of not only individual buildings, but also residential complexes and complex housing developments.

This Technical Information publication has been compiled based on state-of-the-art technology and our experience. However, in view of the diversity in substrates and property conditions, the purchaser/user is still obligated to assume responsibility for professionally checking our materials to ensure their suitability for the intended use under the conditions of each respective property. This publication will be replaced if a newer version is published.
Status analysis/condition
- Render/plaster coating free of damage and technically intact
- Uncoated or coated
- Weathered and/or dirty depending on age

| Intermediate coat | ThermoSan, max. 10 % thinned with water |
| Finishing coat | ThermoSan, max. 5 % thinned with water |

* Use biocides safely. Always read the label and product information before use.
ETICS systems

Renovation of façades

### Products

- **OptiGrund E.L.F.**
  - SilaCryl-based, deeply penetrating, hydrophobic special primer.
- **AmphiSilan primer**
  - Solvent-based, odour-free special primer with solidifying effect.
- **CapaGrund Universal**
  - White pigmented special primer, highly permeable to water vapour, based on SolSilan technology.
- **Sylitol Minera**
  - High-build, crack-filling, silicate-based coating.
- **FibroSil**
  - Coating-fleece for covering cracks, diffusible.
- **PermaSilan**
  - Silicone resin-based, elastic façade paint, diffusible, with a preservative to protect the coating against algae and fungal attack.
- **ThermoSan**
  - Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.
- **Sylitol Konzentrat 111**
  - Silicate-based primer and thinner (concentrate) for Sylitol paints and renders/plasters.
- **Capatect SI Façade Finish 130**
  - Dispersion silicate paint for mineral substrates.

### Status analysis/condition

#### Products

The product to be used must be selected depending on the type (binder) of the existing render/plaster system.

- **Plaster Primer 610**
  Priming coating for subsequent render/plaster finish.

- **Capatect Mortar ZF 699**
  Cement-free reinforcement mortar.

- **CarbonSpachtel**
  Hard-wearing, carbon fibre-reinforced, dispersion-based reinforcement mortar to create heavy-duty reinforced renderings.

- **Capatect Adhesive and Reinforcement Mortar 190 or ArmaReno 700**
  Cement-based reinforcement mortar.

- **Capatect Mesh 650**
  Glass fibre mesh for reinforcement.

- **Capatect Façade Render/Plaster**
  Dispersion-based textured render/plaster.

- **AmphiSilan Façade Render/Plaster**
  Silicone resin-based textured render/plaster.

- **Sylitol Façade Render/Plaster**
  Silicate-based textured render/plaster.

- **Capatect Mineral Render/Plaster**
  Lime cement-based textured render/plaster.

- **Capatect Mineral Lightweight Render/Plaster**
  Lime cement-based textured render/plasters.

- **Capatect-SI Façade Finish 130**
  Dispersion silicate paint for mineral substrates.

- **ThermoSan**
  Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.
### Status analysis/condition
- Partial or complete flaking of the finishing plaster

#### Measure

### Partial or complete replacement of the finishing plaster

<table>
<thead>
<tr>
<th>Procedural steps</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cleaning</strong></td>
<td>Mechanically remove all traces of loose or poorly bonded finishing plaster, i.e. using a scraper or other suitable tool. Avoid damaging the reinforcement layer. In case of partial demaged areas choose an architecturally appropriate demarcation line.</td>
</tr>
<tr>
<td><strong>Priming coat (optional)</strong></td>
<td>Plaster Primer 610</td>
</tr>
<tr>
<td><strong>Variant 1</strong></td>
<td>Organic-based render/plaster</td>
</tr>
</tbody>
</table>
| **Render/plaster** | Apply render/plaster and match the structure to surrounding areas:  
  - Capatect Façade Render/Plaster  
  - AmphiSilan Façade Render/Plaster  
      
| **Variant 2**     | Mineral-based render/plaster                                                                                                                                                                                                        |
| **Render/plaster** | Apply render/plaster and match the structure to surrounding areas:  
  - Sylitol Façade Render/Plaster  
  - Capatect Mineral Render/Plaster  
  - Capatect Mineral Lightweight Render/Plaster  
      
| **Paint coating** | To visually conceal repair spots when reworking partial areas, it is always recommended to coat the entire surface of the affected façade section. See page 8 for the paint coating system. |

The render/plaster must be selected depending on the existing reinforcement layer (organic- or mineral-based) and the condition.

- **Plaster Primer 610**
  Priming coating for subsequent render/plaster finish.

- **Capatect Façade Render/Plaster**
  Dispersion-based textured render/plaster.

- **AmphiSilan Façade Render/Plaster**
  Silicone resin-based textured render/plaster.

- **Sylitol Façade Render/Plaster**
  Silicate-based textured render/plaster.

- **Capatect Mineral Render/Plaster,**  
  **Capatect Mineral Lightweight Render/Plaster**
  Lime cement-based textured renders/plasters.

- **ThermoSan**
  Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.
## Status analysis/condition
- Finishing plaster and rendering is partially damaged
- Insulating material is intact

## Measure

### Products

The material must be selected depending on the existing coating (organic- or mineral-based) and the condition.

- **Capatect Mortar ZF 699**
  Cement-free reinforcement mortar.
- **Capatect Adhesive and Reinforcement Mortar 190 or ArmaReno 700**
  Cement-based reinforcement mortar.
- **Capatect Mesh 650**
  Glass fibre mesh for reinforcement.
- **Capatect Façade Render/Plaster**
  Dispersion-based textured render/plaster.
- **AmphiSilan Façade Render/Plaster**
  Silicone resin-based textured render/plaster.
- **Sylitol Façade Render/Plaster**
  Silicate-based textured render/plaster.
- **Capatect Mineral Render/Plaster**
  Lime cement-based textured render/plaster.
- **Capatect Mineral Lightweight Render/Plaster**
- **ThermoSan**
  Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.

### Repair and completion of the reinforcement layer and new plasterwork

#### Procedural steps

- **Preparation measures**
  In case of partial damaged areas choose an architecturally appropriate demarcation line. Overlay zones must be created for the new coating to be applied.
  1. Cleanly cut out the damaged area of the coating and remove from the insulating material.
  2. Scrape off the existing reinforcement layer, approx. 10 cm wide, all round up to the fabric.
  3. Scrape off the existing finishing plaster, approx. 5 cm wide, up to the reinforcement layer.

<table>

Status analysis / condition
- Partial damage with destroyed insulating boards

Measure

Replacement of damaged insulating board sections and render/plaster repair

Procedural steps

- **Preparation measures**
  1. Cleanly cut out the damaged area incl. the insulating boards and remove.
  2. Remove the finishing plaster and rendering, approx. 5 cm wide, all round up to the insulating board surface.
  3. Scrape off the existing reinforcement compound, approx. 10 cm wide, all round up to the fabric.
  4. Scrape off the existing finishing plaster, approx. 5 cm wide, up to the reinforcement layer.

- **Insulating material**
  Affix a precisely cut section of insulating material in the form of a “seal”.

**Variant 1**

- **Reinforcement layer**
  Apply Capatect cement free reinforcement mortar ZF 699 or CarbonSpachtel with corresponding overlaps, embed Capatect Mesh 650 and smooth over again with mortar.

- **Render/plaster**
  Apply render/plaster and match the structure to surrounding areas:
  - Capatect Façade Render/Plaster
  - AmphiSilan Façade Render/Plaster

**Variant 2**

- **Reinforcement layer**
  Apply Capatect Adhesive and Reinforcement Mortar 190 or ArmaReno 700 with corresponding overlaps. Embed Capatect Mesh 650 and smooth over again with mortar.

- **Render/plaster**
  Apply render/plaster and match the structure to surrounding areas:
  - Sylitol Façade Render/Plaster
  - Capatect Mineral Render/Plaster
  - Capatect Mineral Lightweight Render/Plaster

- **Paint coating**
  To visually conceal repair spots when reworking partial areas, it is always recommended to coat the entire surface of the affected façade section. See page 8 for the paint coating system.

The product to be used must be selected depending on the type (binder) of the existing coating and the existing insulating material.

- **Capatect façade insulating boards**
  Polystyrene or mineral wool.

- **Capatect Mortar ZF 699 or CarbonSpachtel**
  Cement-free reinforcement mortar.

- **Capatect Adhesive and Reinforcement Mortar 190 or ArmaReno 700**
  Cement-based reinforcement mortar.

- **Capatect Mesh 650**
  Glass fibre mesh for reinforcement.

- **Capatect Façade Render/Plaster**
  Dispersion-based textured render/plaster.

- **AmphiSilan Façade Render/Plaster**
  Silicone resin-based textured render/plaster.

- **Sylitol Façade Render/Plaster**
  Silicate-based textured render/plaster.

- **Capactect Mineral Plaster/Render, Capatect Mineral Lightweight Render/Plaster**
  Lime cement-based textured renders/plasters.

- **ThermoSan**
  Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.
### Status analysis / condition
- The entire surface of the finishing plaster and rendering on EPS insulation is damaged and cannot be repaired

### Measure

#### Full replacement of the render/plaster coating

<table>
<thead>
<tr>

<td><strong>Capatect-SI Façade Finish 130</strong> Dispersion silicate paint for mineral substrates.</td>
</tr>
<tr>
<td></td>
<td><strong>ThermoSan</strong> Innovative silicone resin binder combination with integrated nano-quartz particles for clean façades. Optimal moisture regulating properties. ThermoSan is protected against algae and fungal attack.</td>
</tr>
</tbody>
</table>

#### Variant 1
- Organis-based system
  - **Reinforcement layer**: Apply Capatect cement free reinforcement mortar ZF 699 or CarbonSpachtel, embed Capatect Mesh 650 and smooth over again with filler.
  - **Render/plaster**: Apply and structure as desired:
    - Capatect Façade Render/Plaster
    - AmphiSilan Façade Render/Plaster

#### Variant 2
- Mineral-based system
  - **Reinforcement layer**: Apply Capatect Adhesive and Reinforcement Mortar 190 or ArmaReno 700, embed Capatect Mesh 650 and smooth over again with mortar.
  - **Render/plaster**: Apply and structure as desired:
    - Sylitol Façade Render/Plaster
    - Capatect Mineral Render/Plaster
    - Capatect Mineral Lightweight Render/Plaster
  - **Paint coating (optional)**: Capatect SI Façade Finish 130 as a equalising coloured coating for painted mineral renders/plasters.
  - **Paint coating (optional)**: algae/fungal protection
    - ThermoSan, max. 10 % thinned with AmphiSilan Tiefgrund LF
    - ThermoSan, 5 % thinned with water

#### Preparative measures
- "Strip off" the damaged coating. To do so, make approx. 5 mm deep incisions in sections and peel off the coating in strips.
- Grind down the remaining EPS insulating boards.
- Replace any damaged insulating boards. Carry out dowelling, if necessary.
### Insulation doubling and new render/plaster finish, variant 1 (EPS + EPS) in accordance with technical approval Z-33.49-1071

#### Principle requirements for doubling:
- A diffusion calculation establishing the functional capability of the structural-physical aspects must be carried out.
- An all-round fireproof barrier or mineral wool strip must be installed on the lintel if the overall insulation layer thicknesses of the old and new system are > 10 cm polystyrene.
- Bonding and dowelling must always be carried out.
- The current requirements of the respective regulation for energy saving in buildings and building systems (e.g. EnEV in Germany) must be complied with.
- Dowelling with approved dowels through both layers in the load-bearing masonry must be carried out.
- Doubling of rail (profile) systems is not permitted.
- Multiple doubling is not permitted.
- Bonding with adhesive foam is not permitted.
- The minimum thickness of the new system must be 40 mm.
- The maximum overall thickness of the insulating material must be ≤ 300 mm.

#### Procedural steps

<table>
<thead>
<tr>
<th>Preparation measures</th>
<th>Check the condition of the existing ETICS system as regards load bearing capacity measures. If necessary, carry out detail adjustments (e.g. horizontal covers).</th>
</tr>
</thead>
<tbody>
<tr>
<td>New ETICS system</td>
<td>Bond insulating boards (bonding of partial areas optional) Dowel complete system structure Form connection joints Install edge protection profile Apply reinforcement layer Priming coat (optional) Apply render/plaster coating Paint coating (optional)</td>

#### Products
The new Capatect ETICS system (to be applied) must be selected according to the technical and design specifications.

- **Insulating material**
  - Polystyrene rigid foam
  - Mineral wool boards (fire barrier)
  - Mineral wool lamellae (fire barrier)

- **Reinforcement layer**
  - Organic-based
  - Mineral-based

- **Renders/plasters**
  - Dispersion-based
  - Silicone resin-based
  - Silicate-based
  - Lime cement-based
Principle requirements for doubling:
- A vapour diffusion calculation establishing the functional capability of the structural-physical aspects must be carried out.
- The current requirements of the respective regulation for energy saving in buildings and building systems (e.g. EnEV in Germany) must be complied with.
- Bonding and dowelling must always be carried out.
- Dowelling with approved dowels through both layers in the load-bearing masonry must be carried out.
- Doubling of rail (profile) systems is not permitted.
- Multiple doubling is not permitted.
- Bonding with adhesive foam is not permitted.
- The minimum thickness of the new system must be 40 mm.
- The maximum overall thickness of the insulating material must be ≤ 200 mm.

Products

The new Capatect ETICS system (to be applied) must be selected according to the technical and design specifications.
- **Insulating material**
  - Mineral wool boards
  - Mineral wool lamellae
- **Reinforcement layer**
  - Mineral-based
- **Renders/plasters**
  - Lime cement-based

Insulation doubling and new render/plaster finish, variant 2 (MW + MW) in accordance with technical approval Z-33.49-1071
### Principle requirements for doubling:
- A vapour diffusion calculation establishing the functional capability of the structural-physical aspects must be carried out.
- An all-round fireproof barrier or mineral wool strip must be installed on the lintel if the overall insulation layer thicknesses of the old and new system are > 10 cm polystyrene.
- Bonding and dowelling must always be carried out.
- The current requirements of the respective regulation for energy saving in buildings and building systems (e.g. EnEV in Germany) must be complied with.
- Dowelling with approved dowels through both layers in the load-bearing masonry must be carried out.
- Doubling of rail (profile) systems is not permitted.
- Multiple doubling is not permitted.
- Bonding with adhesive foam is not permitted.
- The minimum thickness of the new system must be 40 mm.
- The maximum overall thickness of the insulating material must be \( \leq 200 \) mm.

### Procedural steps

#### Preparation measures
Check the condition of the existing ETICS system as regards load bearing capacity measures. If necessary, carry out detail adjustments (e.g. horizontal covers).

#### New ETICS system
- Bond insulating boards (bonding of partial areas optional)
- Dowel complete system structure
- Form connections
- Install edge protection profile
- Apply reinforcement layer
- Priming coat (optional)
- Apply render/plaster coating
- Paint coating (optional)

### Products
The new Capatect ETICS system (to be applied) must be selected according to the technical and design specifications.

#### Insulating material
- Polystyrene rigid foam
- Mineral wool boards (fire barrier)
- Mineral wool lamellae (fire barrier)

#### Reinforcement layer
- Organic-based
- Mineral-based

#### Renders/plasters
- Dispersion-based
- Silicone resin-based
- Silicate-based
- Lime cement-based
